

ABSTRACT

A decorated luminary product includes either a candle (or other light source) or a holder for containing the candle (or other light source), having a mirror film adhered thereto to provide a pleasing visual effect. A decorative web of a polymeric mirror film web is preferably heat shrunk to conform to the shape of the candle or the holder. The mirror film is located to cooperate with light emitted by a candle or other light source to augment the visual effect created when the candle is lit, by providing birefringent effects, changes in coloration in accordance with changes in viewing angle, and variations in both reflectivity of ambient light and transmission of light from the candle or other light source.
